...to accomplish user authentication, passwords are the most common authentication mechanism and often provide adequate protection of computer resources.

Today, most systems offer at least basic password management features. Such features...

...are software or hardware mechanisms that provide a person with the second piece of authenticating information. Included within this group of mechanisms are

* one-time password generators. As the name implies, one-time passwords are similar to traditional passwords because they are used in conjunction with a user ID, but they are limited to...

...use. The advantage of this technique is that it prevents the replay of a compromised password. Often, one-time passwords are used not only in conjunction with user IDs, but also with passwords or PINs.

Commonly, a small handheld device the size of a credit card is synchronized with the target systems authentication scheme and displays a one-time password that periodically changes. To access the target system, the person enters an assigned user ID and password followed by the one-time password currently displayed on the hand-held device. This method of authentication provides additional security because the person must know the information and possess the authentication token.

* challenge-response schemes. These schemes look like onetime password generators and use a similar synchronization mechanism; however, additional user actions are required for authentication...

...DRM software is that it can apply adjustable levels of rights to a piece of content - giving some recipients rights to manipulate content, letting others only view it, or blocking access entirely.

DRM network server software wraps the digital content. DRM client software unwraps it or otherwise makes it accessible in accordance with its rights. Potential clients include desktop PCs, handhelds, settop boxes, mobile phones and other portable devices. Good DRM software has little effect on the network and is generally invisible to the...

...a DRM provider.

At interactive entertainment company Nintendo of America, DRM software from Alchemedia Technologies protects proprietary and sensitive material on the company intranet. The Mirage server intercepts and encrypts designated documents or sections of documents. The Mirage client decrypts and displays the protected document, but the recipient cannot copy, save, print, e-mail or perform a screen capture unless authorized to do so, says Daniel Schreiber, CEO of Alchemedia. The document is decrypted to be viewable but otherwise remains encrypted, even in RAM, he explains.

There are a few signs of enlightenment. The digital telephone services offered by Sprint PCS and VoiceStream use encryption to protect both billing information and the content of calls. The BlackBerry two-way communicator encrypts each message before transmitting it. But security all too often remains an empty promise.

ACE/Server is a centrally managed, integrated information security system that prevents unauthorized access to network information resources in an open systems environment. A client/server implementation of Security Dynamics' positive identification

...
...a perimeter around a client/server environment on the basis of user identification.

The product locks up network client resources and centrally authenticates user identity. It requires local platform-specific software

...
...to a remote, physically secure server.
ACE/Server uses Security Dynamics' SecurID verification technology to protect your network. Each authorized user has his or her own SecurID Card. This is a credit card-sized device, with a liquid crystal display, that generates an unpredictable, one-time access code every 60 seconds. A time-synchronized algorithm...

A SecurID database residing in ACE/Server contains a list of protected SecurID clients and their authorized users. After ACE/Server verifies that the user is authorized...
...access to those network resources for which that user is authorized. It denies access to unauthorized users and maintains an audit trail of both authorized and unauthorized network activity. A principal administrator oversees the network security functions of all SecurID clients and records.

All network resources whether accessed remotely, via a gateway or by a direct connection - can be protected by the ACE/Server. The software resides on a SunOS or ULTRIX platform, and it...

Despite such warnings, security experts overall note that the new generation of hand-held devices might prove more effective than security schemes currently used.

To protect e-mail messages from intruders such as the FBI's Carnivore, quantaMail provides users with the ability to encrypt, compress, and password protect any new e-mail message. QuantaMail can also notify the sender when the recipient has read the message, indicating the time and date of receipt. Time stamps are acquired from an atomic clock...

Using quantaMail does not require the sender or recipient to acquire a new e-mail address or discard their favorite e-mail services. The quantaMail client software compresses and encrypts...

...the life span of an e-mail message. The sender can "destroy" an e-mail message after a specified period of time, on a pre-set date, or after a certain number of reads by the recipient. Once destroyed, the message is protected by 2040 bit Blowfish encryption.

QuantaMail will run as an integrated Outlook 97/98/2000 add-in and encrypted messages can be sent to any e-mail recipient running Windows 95/98/ME/NT/2000, even if the recipient is not a registered quantaMail user. New PC access device, SecurLock, provides users with secure log-on & total data security; USB key token &

...provides single sign-on (SSO) and data encryption, and security is
enhanced with the login data being encrypted and saved on the USB
token. Now at SecurLock 1.3, the product...the safe storing and management
of the user's profiles, such as user name and password.

Now at version 1.3, SecurLock comes complete with its data
shredding facility to allow users to delete sensitive data
permanently, making it virtually impossible to recreate shredded
files. Depending on the sensitivity of the data, users can
choose from four data shredding ...also provides a disk clean-up
feature for wiping special folders, such as temporary internet files
, history, cookies and recent documents.

General Manager of SecurSoftware's European office, Interphenix
Europe, Antoine el Khoury, comments: "By saving the PIN, encryption
key and sign-on profiles on the USB token itself, data is utterly
protected from unauthorised access. If the user loses the
key, but remembers the password phrase, a new key can be programmed
by the administrator of the system.

Commenting on the new shredding function, Antoine continues: "In
normal usage, any deleted file can be recovered. With SecurLock's
shredder, it disposes of the file completely, which for businesses

means that company-specific data such as financial performance, new product development, and strategic direction can be completely deleted by those users who receive such information, but typically only need to read it once. In addition, nearly every PC user creates, receives or uses data that is sensitive or personal in nature, and equally wants to delete such data. It would probably take the full computing resources and expertise of the CIA to be able to recover the data."

SecurLock 1.3 is compatible with MS Windows XP Professional , MS Windows XP Home Edition , Tablet PC O.S, Microsoft Windows 2000 Professional , Microsoft Windows ME , and Microsoft Windows 98 . It is

DRM network server software wraps the digital content. DRM client software unwraps it or otherwise makes it accessible in accordance with its rights. Potential clients include desktop PCs, handhelds, set-top boxes, mobile phones and other portable devices

At interactive entertainment giant Nintendo of America, DRM software from Alchemedia Technologies protects proprietary and sensitive material on the company intranet. The Mirage server intercepts and encrypts designated documents or sections of documents. The Mirage client decrypts and displays the protected document, but the recipient cannot copy, save, print, e-mail or perform a screen capture unless authorized to do so, says Daniel Schreiber, CEO of Alchemedia. The document is decrypted to be viewable but otherwise remains encrypted, even in RAM, he explains.

The readout would confirm the reservation, suggest a rate and ask whether you'd like to check in. "You hit 'yes' on your phone, touch in your PIN, and you're checked in," Nicholas says. "The server, connected with the property management system, would instruct the check-in and confirm it with your room number." Text would appear on your screen directing you to your room, which your phone, effectively a wireless key, would open.

"When you get close, the lock communicates the same way," Nicholas says. "It's 'looking' for your phone. Within 10 or 15 feet, an apparatus attached to the lock has an antenna sending a radio signal to the phone, which appears as a text message telling you to enter your PIN. Once you do, the lock will open
